

Remote Data Protection Service (RDPS)

At Fresno Networks we understand how critical data is to your business. To ensure the protection of your data we have developed a remote data protection service. Through this automated secured service we backup your data to our remote servers. In the event of data loss your data can be immediately restored to your systems via the Internet. We can also deliver a complete copy of your data within hours in the event of a total system failure.

Service Highlights

Completely Automated – Our backup service is installed as a local software package on your systems. The backup service is configured to backup each file that has been modified since the last backup. The files are then sent from your system to our servers over high-speed Internet lines.

Offsite Data Storage – During our hectic business day it is difficult to prepare for data disasters (theft, fire, corrupt backup data or backup tapes, hardware failure, etc.). One simple way to protect your business data is by storing a copy offsite. Through our remote backup service you have the security of knowing your data is safe at an alternate location. Our backup servers are local and we can provide a complete copy of your data at anytime. In addition, we archive data monthly to a secured vault.

Immediate Data Restoration – Files can be accidentally deleted and permanently lost. Through our backup service the customer can restore any file at any time with or without our assistance.

Security – You have undoubtedly heard about security issues on the Internet. Rest assured that our system uses the highest data encryption algorithms. Your data will never be comprised by unauthorized access.

Free Backup Monitoring – Fresno Networks monitors that status of each backup job to ensure your data backup jobs are running successfully.

Server and PC Backups – Our remote backup software will support any Microsoft Windows computer. This allows our service to backup data located on your servers, desktop or laptop computers.

Flexible Data Protection Plans – Fresno Networks understands that the data backup needs of each organization are unique. To meet this demand, we have designed multiple plans to meet your specific requirements and budget. We can also create a customized data protection plan if needed.

Remote Data Protection Service (RDPS) Plan Details
